SUMMARY

M.S. Computer Science student with 6 years of experience building backend systems and data integration tools, including Spring Boot REST services, Python ETL pipelines, and PostgreSQL-backed applications deployed in production.

EDUCATION

Northeastern University

M.S. in Computer Science

Sep 2025 – Dec 2027

Seattle, WA, USA

Tunghai University

B.A. in Industrial Design

Sep 2013 – Jun 2017

Taichung, Taiwan

PROFESSIONAL EXPERIENCE

Supertung Industrial Co., Ltd.

Overseas Procurement Specialist / Automation Developer

Mar 2019 – Mar 2025

Taichung, Taiwan

- Reduced monthly procurement data consolidation from 3 days to under 1 hour by developing and deploying an internal ERP integration tool across 15+ vendor export formats.
- Reduced inventory status inquiries by 40% by building an Apps Script-backed Google Sheets tracker with automated data refresh, lookup logic, and stock allocation calculations from ERP inventory and inbound shipment data.
- Sustained \$6M in COVID-era import volume by developing a Python capacity-planning model that joined purchase orders, ETA data, outbound commitments, and warehouse limits to forecast utilization across shipment schedules.

Brantabee Italia

Software Engineering Intern

Aug 2017 – Jan 2018

Corciano, Italy

- Developed a Spring Boot REST service that received RFID scan events, mapped each event to a product state change, and persisted RFID-driven inventory state transitions in PostgreSQL across 200+ smart wine dispensers.
- Designed idempotent REST APIs for an automated reorder system by enforcing uniqueness constraints at the database level, eliminating duplicate orders and reducing the duplicate-order rate from ~2% to near-zero.

PROJECTS

FlexLab Event Board | Deployed at Northeastern University FlexLab

Feb 2026 – Jun 2026

- Built and deployed a touchscreen event kiosk that rendered workshop and training cards from Supabase via REST API and displayed event images uploaded to Supabase Storage.
- Implemented in-app event registration by validating form inputs and persisting submissions to Supabase for centralized sign-up data collection.
- Built a keyword-matched FAQ chatbot with quick-reply buttons and a staff-on-duty lookup that queries Supabase daily, with staff schedule data automatically synced from SharePoint Excel through Azure Logic Apps.

Topic Voting Platform | Team Project

Jan 2026 – Apr 2026

- Enforced separation of concerns across all 6 views by routing every business logic call through a single ApplicationController, ensuring no view class contains data retrieval or state management code.
- Enabled the same codebase to run offline or against a live backend without modification by designing a configurable data layer that routes requests to either local CSV repositories or a remote Spring Boot REST API.
- Enforced data integrity in ApplicationController by checking per-session vote history before each submission to block duplicate votes, and throwing a pre-condition exception before persisting any comment from a user who has not yet voted.

ERP Data Integration Tool | Collaborative Project (deployed internally)

Mar 2023 – Dec 2023

- Built a Python application (Tkinter, pandas) that auto-detects header rows across inconsistent Excel layouts, maps raw column names to 15 canonical fields using regex patterns, validates required fields and numeric types before processing, and outputs a consolidated multi-sheet Excel report with a skipped-file log.
- Structured the pipeline into independent ingestion, transformation, and validation layers so that new ERP export formats can be onboarded by adding regex patterns only, with no changes required to transformation or validation logic.

TECHNICAL SKILLS

Languages: Python, Java, SQL

Frameworks: Spring Boot, pandas, PostgreSQL, REST APIs, Tkinter

Cloud & Tools: AWS Certified AI Practitioner · Azure · Git · Google Apps Script

Concepts: MVC + Repository pattern, ETL pipelines, idempotent API design
